

Navier x the Northeast

Electric hydrofoil water taxis for New York and New England · July 2026

In one line: Navier builds electric hydrofoil water taxis in Alameda, California — boats that rise out of the water and fly above it, cutting energy use by up to 90%* — and New York and New England are the best waters in America to put them to work. We are seeking introductions to the region's transportation decision-makers, beginning with NYC EDC.

1 · What Navier is

Navier is a California boatbuilder founded by an MIT, NASA and GoogleX team. Our vessel, the N30, is an eight-passenger electric hydrofoil — a carbon-fibre boat that lifts clear of the water and flies silently above it. No wake, no noise, no emissions, and a smoother ride than any conventional ferry in chop.

This is not a concept. The platform is signed, funded and operating today:

- **Signed — a \$100M national network.** A 100-vessel national ferry network for the Maldives, on this same platform.
- **Deployed — the U.S. Navy.** Deployed with the U.S. Navy and inside Leidos programs — proven beyond the demo dock.
- **A family of vessels.** The 8-seat N30 flying today; a 20-seat N45; and a long-range 8-seat variant built for corridors like Manhattan ↔ the Hamptons.

2 · Why New York, and why now

- **Congestion pricing is working — and the water is the uncongested lane.** In its first year the Congestion Relief Zone cut vehicle entries by 27 million (11%), and transit use rose across subway and bus. The harbor is the one right-of-way in the region with no traffic on it. (*MTA one-year report*)
- **LaGuardia still has no rail link.** The AirTrain LGA project was cancelled in March 2023, and the Port Authority set aside \$30M to study alternatives. The Marine Air Terminal sits directly on the water — minutes from Midtown by foil. (*PANYNJ*)
- **NYC Ferry is at record demand, on diesel.** More than 7.1 million boardings in FY24 — a record — on a conventional diesel catamaran fleet, at a \$9.09 per-passenger operating subsidy. The City has said it will begin a study of transition to zero-emission vessels. (*NYCEDC NYC Ferry FY24 Annual Report*)
- **The East End's only fast link to Manhattan is by air.** Blade reported 94,733 short-distance seats flown and \$72.2M in short-distance revenue in FY2024 (company-wide). A foiling vessel offers dock-to-dock, all-weather service at a fraction of the cost per seat. (*Blade Air Mobility 2024 Form 10-K*)
- **New England is actively planning for exactly this.** MBTA's ferry operator reports more than 1.4 million passengers carried in 2024; the MassDOT-MBTA Water Transportation Study runs through summer 2026; Massport has accelerated its Net Zero target to 2028; and the Steamship Authority — 2.96 million passengers in 2025 — has studied alternative propulsion and secured \$28.1M in federal funding for fleet conversion. (*MBTA · Massport · SSA 2025 Annual Report*)

3 · What the economics look like

Three examples from our route model (mid case), with fares benchmarked against the premium road and air alternatives people already pay for:

Corridor	Fare (per seat, one-way)	What one vessel does
East 34th St ↔ LaGuardia	\$75	Pays back its capital in about 2 years
Wall St (Pier 11) ↔ Paulus Hook, Jersey City	\$50	About 2.5 years
Wall St (Pier 11) ↔ Sag Harbor	\$625 — Blade seats run \$195–\$1,025	About 3 years

This is private capital at work: we are not requesting an operating subsidy. Full route models, assumptions and per-market proposals are available on request.

4 · What we've prepared

Complete, route-level proposals are ready for each of the region's decision-makers:

- **NYC EDC / Port Authority** — a Manhattan pilot: the LaGuardia water link and a premium cross-Hudson hop.
- **Suffolk County / NYMTC** — an East End fast-ferry layer, timed to the regional transportation plan.
- **MBTA / Massport** — electrifying Boston Harbor service, and a Logan water link.
- **Woods Hole, Martha's Vineyard & Nantucket Steamship Authority** — the island lifeline crossings, electric.
- **Operators and platforms** — Hornblower / City Experiences and Blade.

5 · The ask

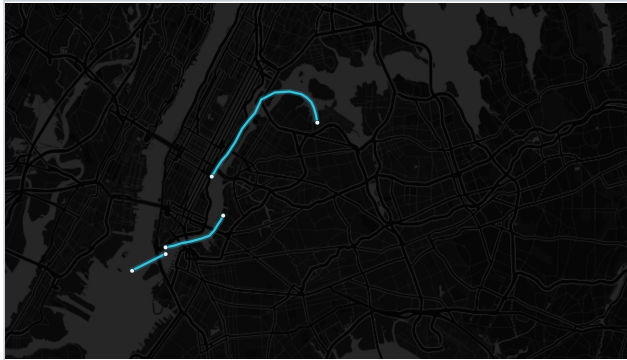

- 01** An introduction to NYC EDC leadership.
- 02** One working session — with your guidance on sequencing across the region.
- 03** A demo flight from our Alameda dock, for anyone who wants to see the boat fly.

Sampriti Bhattacharyya · Founder & CEO, Navier

*Navier company estimate; route-specific energy use requires validation per route. Route economics are Navier route-model outputs (mid scenario) using premium-substitute fare benchmarks; they are illustrations, not commitments.

Appendix · the network, mapped

Every corridor below is drawn pier-to-pier on Navier's Atlas from official terminal locations. Solid gold lines are modeled corridors; fine lines are the wider candidate mesh.

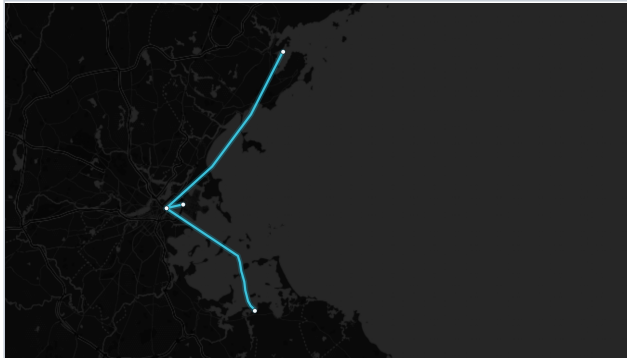

New York Harbor

LaGuardia water link, premium cross-Hudson and East River corridors.

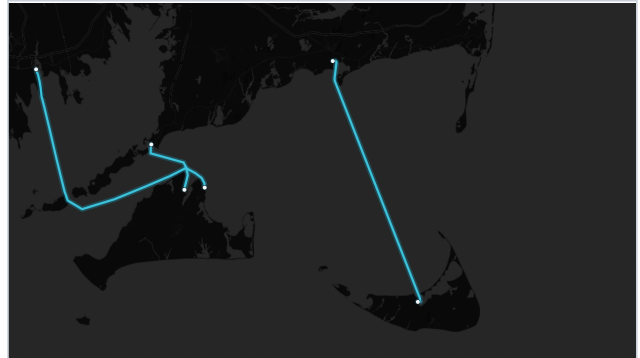

Long Island East End

Manhattan ↔ Sag Harbor and Montauk; Shelter Island local crossings.

Boston Harbor

Hingham, Salem and the Logan water approach.

Cape Cod & the Islands

Woods Hole ↔ Martha's Vineyard and Hyannis ↔ Nantucket.
